Amazon alexa dot 3rd generation

© 1996-2014, Amazon.com, Inc. Check out the Amazon Echo Dot (fourth generation). Amazon's third-generation Echo Dot (\$49) looks good and sounds great. With greatly improved audio, it's now a decidedly better smart speaker than Google Home Mini and can replace the larger \$99 Echo for less discerning people. This makes it our Editor's Choice for entry-level smart speakers. If you already own an old Echo Dot and use it to power a larger and better speaker, you don't need to upgrade. But if you use echo dot as your main speaker, you want a new one. A cuddly dotThe Echo Dot is chubbier and cuddly compared to the previous model, although it is about the same size. Instead of simple hard plastic, the speaker now has a fabric casing in one of three shades of gray. Choose wisely, because unlike the full-size Echo, you can't change the case after you purchase the speaker. Like previous Echo Dots, the speaker has a colorful light ring around the edge and four buttons at the top: volume buttons, a microphone mute, and an action button. I like Echo Dot volume buttons better than the slightly mysterious touch controls of the Home Mini, although you'll almost certainly control the volume with your voice. The speaker has a diameter of 3.9 inches by 1.7 inches in height and weighs 10.6 ounces. It is portable in the sense that it is easy to collect and move from room to room, but must be connected for power. It connects Echo Dot to the Wi-Fi network with the Alexa app or via a web browser. The new Dot supports 802.11ac, which greatly extends the Wi-Fi range for the device over a 5 GHz network when used with an 802.11ac router. From left: Amazon Echo, old Echo Dot, new Echo Dot Better SoundThe sound quality on the single 1.6-inch driver is much, much better than the old Echo Dot. The old Echo Dot sounded abysmal, like a 1960s transistor radio. It was fine for Alexa's voice, but the music was extremely tinny. The new Echo Dot has at least a semblance of bass and a much more rounded mid-range. Take two Echo Dots and you can even form them in a stereo pair. The Dot now sounds noticeably better than google home mini. Home Mini isn't as painfully tinny as the old Dot, but it pushes voices way ahead of any other sound when playing music. Listening to your favorite singers is therefore fun, but you are getting a very false idea of the background instrumentation. The new Dot brings things together at least a little bit better. Now, this is still a small \$50 speaker. The \$99 Echo standard offers bass with much more space and shape than the Dot, for a noticeably better listening experience. But I think this Dot finally finds itself in the realm of the good enough for many that don't necessarily read reviews dedicated to speakers. For everyone else, Echo Dot still has a 3.5mm jack on the back, as well as Bluetooth, to connect to other speakers and audio Music, the new Dot goes up to a very noticeable 7dB stronger than the old one, and about 2dB stronger than google home mini at six inches. Interestingly, the new Dot is only 2dB quieter than the larger Echo. Where the largest Echo stands out is in the shape and quality of the sound: less compressed drums and much better attachment and decay with strings, for example. The Dot had no problem feeling, or being heard, at a 30-foot radius in a quiet room. With the music playing, you're going to have to talk. Alexa vs Google AssistantA While preferring Alexa to the Google Assistant, Amazon lags behind in its ability to answer natural language questions. When it comes to the main things people use smart speakers for - timers, music, weather and news - Amazon and Google are doing well. Alexa is even ahead of Google in accessing calendars from Google accounts, as the Google Assistant is still unable to manage G Suite calendars. Alexa is also ahead of the Google Assistant on smart home control. While Google now prides itself on being able to control 1,000 smart home brands, you can assume that any smart home device will work with Alexa. If voice control of your TV is important, Amazon's range of Fire TV sticks, devices, and smart TVs is much more flexible than Google.Ma's Chromecast ask a couple of speakers, for example, businesses or local directions, and Google flies ahead. The Google Assistant knew the addresses of a local company I needed to get where Alexa didn't know and gave me transit directions there, which Alexa couldn't. Our experience is supported by a major study conducted by advertising agency 360i, which found that in the travel, finance, auto, and retail industries, Google Assistant is much more able to answer arbitrary questions than Alexa.Google also has superior multiuser functions. Google speakers only recognize the voices of various people in a family; Amazon speakers must be told to change accounts. ConclusionsThe new Echo Dot is good enough to be the default Alexa speaker in most rooms in your home. It doesn't sound horribly tinny anymore, and that's half the price of the bigger Echo. If you want better sound, you can easily connect it to a larger speaker of your choice or pair it with another Point as a stereo pair. It is convenient, flexible and attractive and sounds much better than the challenge of Google Home Mini.Amazon right now is in the cloud, not in its hardware. Alexa still rules when it comes to enabling voice to a wide range of hardware from different manufacturers. Supports more smart home devices than Google or Siri and the range of Fire TV devices, both in smart TVs and around apple and google options. It has also recently added some very useful features to its smart displays, while Google Assistant-based smart displays are curiously lagging behind in some features. The Google Assistant is simply easier and more fun to talk to, which is why we recommend Google on Amazon if you start with smart speakers and you're not going to go to a direction of the smart house. Google is more likely to understand what you're asking for and give you good advice. While you can improve Alexa with thousands of third-party skills, their syntax is considerably more demanding than Google's, making the deep use of Alexa an inherently more geeky task. We've released Editors' Choice awards for smart speakers more by hardware than ecosystem, because there are pros and cons with every platform. I'm happy to call the new Echo Dot a choice of publishers and the entry-level Alexa speaker that you should consider right now. It's good enough to be the backbone of any Alexa-enabled home. If you want a visual update without spending too much, the new Amazon Echo Show 5 adds a useful touch screen to the mix, allowing you to tap, scroll, and even browse the web at a price lower than the price of a regular Echo. Watch it \$24.99 on Amazon MSRP \$49.99 Pro Sound much better than the previous model Still the best cheap 3.5mm alexa jack for more powerful speakers Alexa remains the best voice ecosystem for smart home control View more with Alexa not up to the level of the Google Assistant in answering extensive information questions The new Amazon Echo Dot offers greatly improved sound, making it an even better purchase for an entry-level Alexa speaker. Amazon Echo Dot Gen 3 v2, GreyAmazon Echo Dot (3rd Generation)... If Amazon CEO Jeff Bezos takes control of the world, he might have Amazon Echo Dot to thank. Because Amazon does its best to infiltrate every possible product market, every possible home, and every room possible, the new generation Echo Dot 3rd is perhaps the most enticing way to bring Amazon's Alexa voice assistant to your home. But if you like the idea of a smart assistant combined with a simple music speaker, it's hard to argue against Echo Dot.Read our guide to Amazon Prime DayBuildYe remains something quite futuristic about blowing commands and listening to responses from a small electronic voice in a box, but on the surface everything about this product is pretty simple. The small disk-shaped design remains, but it has been revived and improved on this third-generation Dot.Fabric replaces the hard exterior of the previous model, and the controls on the top of the device also had a makeover. As a result, it looks noticeably smarter: we see it as a nice addition to a room rather than something you want to tuck out of the You need to connect Echo Dot to power and wire other devices via the 3.5mm aux output for better sound, but otherwise it can go anywhere your voice can hear. Once turned on, it's easy to use the Amazon Alexa app and connect it to your wi-fi network. The 3.5mm audio output and Bluetooth connectivity are about what you get This means that if you want a bigger and better sound than echo dot can provide, you can make a wired or wireless connection to another device. Otherwise, it's Alexa in terms of functionality. And it's worth pointing out that all this connectivity, and everything Alexa can do, is in line with the second-generation Echo Dot.Alexa can still play music, answer questions, read news, control weather, set alarms, and control compatible smart home devices, from TVs to amplifiers and home cinema speakers. And you can control Spotify and TuneIn, as well as Amazon Music. Voice calls are a relatively new addition, while the number of Skills - devices that work with Alexa - are constantly growing and include an entire suite of products from Sonos to Domino's Pizza and Uber.New, it's a new driver and a change to the microphone layout. There is a 4cm driver here compared to 3cm on the previous model and Amazon says it is 70 per cent stronger as a result. Interestingly, there are fewer microphones, four instead of seven, but design changes aim to make performance just as strong. Sound The three key strands of the Point performance are how well Alexa feels, how much the speaker plays (for answers and music) and what it can do. The previous Echo Dot was already pretty impressive in terms of listening to your commands, and we're just as pleased with the performance here. Even with playing music, a clear command will wake Alexa up. Understanding your question and allowing accents means it's not perfect but, for the most part, it's pretty impressive. Alexa, what are the news headlines? and Alexa, what's the weather? they turn out to be easy; Alexa, play some rap French pulls up a relevant Spotify playlist, while Alexa, say something in French returns the real world French for something - just the kind of smart Alec answer that IA hopes to improve in the coming years. Amazon Echo Dot Technology Specifications (Third Generation)Wi-Fi YesBluetooth Yes Outputs 3.5mmDimensions (hwd) 43 x 99 x 99mmWeight 300gWe add Sonos ability and soon we can control music on a multi-room system of Sonos devices. Of course, Echo Dot must be able to hear you, but you can also talk to the Alexa app on your phone when you're earless. Compatible AV brands include Denon, Marantz, Onkyo, Pioneer, Yamaha.La sound quality is arguably the most impressive update here. Despite similar size, the change to the driver has clearly had a positive effect. It's stronger, for sure, but it's better than that. The lean, thin sound of previous models, which was comfortably enhanced by Google Home Mini, has been replaced by real bass notes, full-bodied voices, and smoother highs. This that we don't really mind Echo Dot as a background music device. Of course, your main hi-fi system should be something better if possible, but for the kitchen or children's room, or for the occasional convenience, we don't mind the music playing on this cheap little speaker. And this is is Something. More relevant perhaps, it means that Alexa always sounds much more enjoyable: clear, strong and easy to understand. VerdictThe latest Echo Dot is the easiest, cheapest and best way to bring Alexa to your home. It works well on its own or can be well integrated into a myriad of other smart home and AV products, taking away voice control and smart features. In line with the latest Amazon Echo products, the sound quality has greatly improved, and while for a correct smart speaker an update to even the most substantial 2018 version of Amazon Echo Plus would be money well spent, this remains a simple and effective smart speaker that is easy to recommend.
